(54) Title: CHEMICAL COMPOUNDS

\* p=0.096 vs control; \*\* p=0.094 vs control

(57) Abstract: Phosphoramidate derivatives of nucleotides and their use in the treatment of cancer are described. The base moieties of, for example, each of deoxyuridine, cytarabine, gemcitabine and citidine may be substituted at the 5-position. The phosphoramidate moiety has attached to the P atom an aryl-O moiety and an  $\alpha$ -amino acid moiety. The  $\alpha$ -amino acid moiety may correspond to or be derived from either a naturally occurring or a non-naturally occurring amino acid.

## Chemical Compounds

The present invention relates to nucleotide derivatives and their use in the treatment of cancer.

5

Nucleoside analogues such as fluorodeoxyuridine (1), cytarabine (2) and gemcitabine (3) are well established as anticancer agents. They function as inhibitors of DNA synthesis after activation to their 5'-phosphate form.

The free bioactive phosphate forms do not in general represent useful drugs due to their poor membrane permeation. In an effort to circumvent this a number of phosphate pro-drug approaches have been reported [Rosowsky et al, J. Med. Chem., 1982, 25, 171-8; Hong et al, J. Med. Chem., 1985, 28, 171-8; Kodama et al, Jpn. J. Cancer Res., 1989, 80, 679-85; Hong et al, 1979, 22, 1428-32; Ji et al, J. Med. Chem., 1990, 33, 2264-70; Jones et al, Nucleic Acids Res., 1989, 17, 7195-7201; Hunston et al, J. Med. Chem., 1984, 27, 440-4; Lorey et al, Nucleosides Nucleotides, 1997, 16, 1307-10; Farquhar et al, J. Med. Chem., 1983, 26, 1153-8; Shuto et al, Nucleosides Nucleotides, 1992, 11, 437-46; Le Bec et al, Tet. Letts., 1991, 32, 6553-6; Phelps et al, J. Med. Chem., 1980, 23, 1229-32].

In general the phosphate prodrugs have biological properties and therapeutic activities that are similar to, or somewhat lower than, the parent nucleoside analogue.

25 We have carried out extensive work in this area from an antiviral perspective, largely on dideoxy nucleosides, and have reported a phosphoramidate approach which has been widely adopted for the delivery of bio-active phosphates of antiviral nucleosides.

An example is the phosphoramidate (4) derived from anti-HIV d4T (5).

We observed the effect of variations in the ester [McGuigan et al, AVCC, 1998, 9, 473-9],  
 5 amino acid [McGuigan et al, Antiviral Res., 1997, 35, 195-204; AVCC, 2000, 11, 111-6],  
 and aryl [Siddiqui et al, J. Med. Chem., 1999, 42, 393-9] regions of the phosphoramidate,  
 as well as the effect of amino acid stereochemistry [McGuigan et al, AVCC, 1996, 7, 184-  
 8], phosphate stereochemistry [Allender et al, Analytica Chim. Acta, 2001, 435, 107-13]  
 and nucleoside [Balzarini et al, BBRC, 1996, 225, 363-9; McGuigan et al, BioOrg. Med,  
 10 Chem. Lett., 1996, 6, 2369-62; McGuigan et al, Bioorg. Med. Chem. Lett., 2000, 10, 645-  
 7].

This work has lead to the optimal description of phenyl methoxyalaninyl phosphoramidate  
 as the prototype pro-moiety for the intracellular delivery of bioactive nucleotides  
 15 [Balzarini et al, PNAS, 1996, 93, 7295-9; McGuigan et al, J. Med. Chem., 1996, 39, 1748-  
 53].

Lackey et al [Biochem Pharmacol., 2001, 61, 179-89] have reported the application of our  
 phosphoramidate pro-drug method for antiviral nucleosides to the anti-herpetic agent  
 20 bromovinyl-2'-deoxyuridine (BVDU) (6). In particular, they have found that the phenyl  
 methoxyalaninyl phosphoramidate (7) has significant anti-cancer activity. This is in  
 marked contrast to the parent (antiviral) nucleoside (6).

Limited SAR has been presented by this group, although in their patent applications [WO0239952, EP1200455, CA2317505, US6339151, EP116797, AU2451601] they claim a series of general variations in the base, and phosphate regions. However, based on our  
 5 prior art, the phenyl methoxyalaninyl phosphoramidate (7) would be anticipated to be amongst the most optimal of structures.

Surprisingly, it has now been found that other derivatives of oxyamino acid-phosphoramidate nucleoside analogues are significantly more potent in the treatment of  
 10 cancer than the phenyl methoxyalaninyl phosphoramidate (7).

According to a first aspect of the present invention there is provided a compound of formula I:

15

wherein:

R is selected from the group comprising alkyl, aryl and alkylaryl;

R' and R'' are, independently, selected from the group comprising H, alkyl and alkylaryl, or R' and R'' together form an alkylene chain so as to provide, together with the C atom to

20 which they are attached, a cyclic system;

Q is selected from the group comprising -O- and -CH<sub>2</sub>-;

X and Y are independently selected from the group comprising H, F, Cl, Br, I, OH and methyl (-CH<sub>3</sub>);

Ar is a monocyclic aromatic ring moiety or a fused bicyclic aromatic ring moiety, either of  
 25 which ring moieties is carbocyclic or heterocyclic and is optionally substituted;

Z is selected from the group comprising H, alkyl and halogen; and

n is 0 or 1,

wherein

when n is 0, Z' is -NH<sub>2</sub> and a double bond exists between position 3 and position 4,

and

5 when n is 1, Z' is =O;

or a pharmaceutically acceptable derivative or metabolite of a compound of formula I;

with the proviso that when n is 1, X and Y are both H, R is methyl (-CH<sub>3</sub>), one of R' and

10 R'' is H and one of R' and R'' is methyl (-CH<sub>3</sub>), then Ar is not phenyl (-C<sub>6</sub>H<sub>5</sub>).

By "a pharmaceutically acceptable derivative" is meant any pharmaceutically acceptable salt, ester or salt of such ester or any other compound which upon administration to a recipient is capable of providing (directly or indirectly) a compound of formula (I).

15

Suitably, except where R is 2-Bu (-CH<sub>2</sub>-CH(CH<sub>3</sub>)<sub>2</sub>) and one of R' and R'' is H and one of R' and R'' is methyl (-CH<sub>3</sub>), when n is 1 and X and Y are both H, then Ar is not unsubstituted phenyl (-C<sub>6</sub>H<sub>5</sub>).

20 By "pharmaceutically acceptable metabolite" is meant a metabolite or residue of a

compound of formula (I) which gives rise in use to a compound of formula (II):

wherein n, Q, R, R', R'', X, Y, Z and Z' have the meanings described above and below for

25 formula I, and additionally R can be H, with the proviso that when n is 1, X and Y are both

H, R is methyl ( $-\text{CH}_3$ ), one of  $\text{R}'$  and  $\text{R}''$  is H and one of  $\text{R}'$  and  $\text{R}''$  is methyl ( $-\text{CH}_3$ ), then Z is not  $-\text{CH}=\text{CHBr}$ .

Suitably, with respect to compounds of formula II, when n is 1 and Z either is or is not –  
5  $\text{CH}=\text{CHBr}$ , the moiety  $\text{ROCOCR}'\text{R}''\text{NH}-$  corresponds neither to alanine (ie as above, R is not methyl ( $-\text{CH}_3$ ), one of  $\text{R}'$  and  $\text{R}''$  is not H and one of  $\text{R}'$  and  $\text{R}''$  is not methyl ( $-\text{CH}_3$ )) nor to tryptophan (ie  $\alpha$ -amino- $\beta$ -indolylpropionic acid).

More suitably with respect to compounds of formula II, when n is 1 and Z either is or is not  
10  $-\text{CH}=\text{CHBr}$ , the moiety  $\text{ROCOR}'\text{R}''\text{NH}$  is neither derived from nor corresponds to any naturally occurring amino acid.

Even more suitably, with respect to compounds of formula II, when n is 1 or 0, the moiety  $\text{ROCOCR}'\text{R}''\text{NH}-$  does not correspond to alanine (ie R is not methyl ( $-\text{CH}_3$ ), one of  $\text{R}'$  and  
15  $\text{R}''$  is is not H and one of  $\text{R}'$  and  $\text{R}''$  is not methyl ( $-\text{CH}_3$ )), does not preferably correspond to tryptophan, and even more preferably the said moiety does not correspond to any naturally occurring amino acid.

Most preferably the moiety  $\text{ROCOCR}'\text{R}''\text{NH}-$  in compounds of formula II corresponds to a  
20 non-naturally occurring amino acid.

Reference in the present specification to an alkyl group means a branched or unbranched, cyclic or acyclic, saturated or unsaturated (e.g. alkenyl or alkynyl) hydrocarbyl radical. Where cyclic, the alkylene group is preferably  $\text{C}_3$  to  $\text{C}_{12}$ , more preferably  $\text{C}_5$  to  $\text{C}_{10}$ , more  
25 preferably  $\text{C}_5$  to  $\text{C}_7$ . Where acyclic, the alkyl group is preferably  $\text{C}_1$  to  $\text{C}_{16}$ , more preferably  $\text{C}_1$  to  $\text{C}_6$ .

Reference in the present specification to an aryl group means an aromatic group containing 5 to 14 ring atoms, for example phenyl or naphthyl. The aromatic group may be a  
30 heteroaromatic group containing one, two, three or four, preferably one, heteroatoms selected, independently, from the group consisting of O, N and S. Examples of such heteroaromatic groups include pyridyl, pyrrolyl, furanyl and thiophenyl. Preferably, the aryl group comprises phenyl or substituted phenyl.

The alkyl and aryl groups may be substituted or unsubstituted. Where substituted, there will generally be one to three substituents present, preferably one substituent. Substituents may include halogen atoms, by which is meant F, Cl, Br and I atoms, and halomethyl groups such as CF<sub>3</sub> and CCl<sub>3</sub>; oxygen containing groups such as oxo, hydroxy, carboxy, carboxyC<sub>1-16</sub>alkyl, alkoxy, alkoyl, alkoyloxy, aryloxy, aryloyl and aryloyloxy; nitrogen containing groups such as amino, C<sub>1-6</sub>alkylamino, diC<sub>1-6</sub>alkylamino, cyano, azide and nitro; sulphur containing groups such as thiol, C<sub>1-6</sub>alkylthiol, sulphonyl and sulphoxide; heterocyclic groups which may themselves be substituted; alkyl groups as defined above, which may themselves be substituted; and aryl groups as defined above, which may themselves be substituted, such as phenyl and substituted phenyl. Substituents on said heterocyclic, alkyl and aryl groups are as defined immediately above.

Reference in the present specification to alkoxy and aryloxy groups means, respectively, alkyl-O- (for example where alkyl is C<sub>1</sub> to C<sub>16</sub>, preferably C<sub>1</sub> to C<sub>6</sub>) and aryl-O- (for example where aryl is a 5 to 14 membered aromatic mono- or bifused ring moiety, optionally containing 1, 2, 3 or 4 heteroatoms selected, independently, from O, S and N, preferably aryl is phenyl).

Reference in the present specification to alkoyl and aryloyl groups means, respectively, alkyl-CO- (for example where alkyl is C<sub>1</sub> to C<sub>16</sub>, preferably C<sub>1</sub> to C<sub>6</sub>) and aryl-CO- (for example where aryl is a 5 to 14 membered aromatic mono or bifused ring moiety, optionally containing 1, 2, 3 or 4 heteroatoms selected, independently, from O, S and N, preferably aryl is phenyl).

Reference in the present specification to alkoyloxy and aryloyloxy means, respectively, alkyl-CO-O (for example where alkyl is C<sub>1</sub> to C<sub>16</sub>, preferably C<sub>1</sub> to C<sub>6</sub>) and aryl-CO-O (for example where aryl is a 5 to 14 membered mono- or bifused aromatic ring system, optionally containing 1, 2, 3 or 4 heteroatoms selected, independently, from O, S and N, preferably aryl is phenyl).

Reference in the present specification to heterocyclic groups means groups containing one or more, pyrrolyl, imidazolyl, pyraziolyl, thiazolyl, isothiazolyl, oxazolyl, pyrrolidinyl,

pyrrolinyl, imidazolidinyl, imidazoliny, pyrazolidinyl, tetrahydrofuranyl, pyranyl, pyronly, pyridyl, pyrazinyl, pyridazinyl, piperidyl, piperazinyl, morpholinyl, thionaphthyl, benzofuranyl, isobenzofuryl, indolyl, oxyindolyl, isoindolyl, indazolyl, indoliny, 7-azaindolyl, isoindazolyl, benzopyranyl, coumarinyl, isocoumarinyl, quinolyl, isoquinolyl,  
 5 naphthridinyl, cinnolinyl, quinazolinyl, pyridopyridyl, benzoxazinyl, quinoxadinyl, chromenyl, chromanyl, isochromanyl and carbolinyl.

The group Ar comprises a substituted or unsubstituted aryl group, wherein the term "aryl group" and the possible substitution of said group is as defined herein. Preferably, Ar is a  
 10 substituted or unsubstituted phenyl group. Particularly preferred substituents are electron withdrawing groups such as halogen (preferably chlorine or fluorine), trihalomethyl (preferably trifluoromethyl), cyano and nitro groups. For example, Ar can be phenyl, 3,5-dichloro-phenyl, *p*-trifluoromethyl-phenyl, *p*-cyano-phenyl, or *p*-nitro-phenyl. When Ar is a heteroaromatic group, preferably it is optionally substituted pyridyl.

15

Suitably, R is a C<sub>1-16</sub> primary or secondary alkyl group, a C<sub>5-7</sub> carbocyclic aryl group or a C<sub>1-6</sub>alkylC<sub>5-11</sub>aryl group. More suitably, R is a C<sub>1-10</sub> alkyl group, a phenyl group or C<sub>1-3</sub>alkylC<sub>5-7</sub> aryl group. Preferably R is unsubstituted.

20 Preferably, R is methyl (-CH<sub>3</sub>), ethyl (-C<sub>2</sub>H<sub>5</sub>), *n*- or *i*- propyl (-C<sub>3</sub>H<sub>7</sub>), *n*- or *i*- butyl (-C<sub>4</sub>H<sub>9</sub>) or benzyl (-CH<sub>2</sub>C<sub>6</sub>H<sub>5</sub>). Most preferably, R is benzyl. Particularly, R is preferably benzyl when one of R' and R'' is H and one of R' and R'' is methyl (-CH<sub>3</sub>), especially when Ar is unsubstituted phenyl, n is 0 and each of X and Y is F.

25 Suitably, R' and R'' are each independently selected from the group comprising H, C<sub>1-6</sub> primary, secondary or tertiary alkyl, C<sub>1-3</sub>alkylC<sub>5-7</sub>aryl, or, when together they form an alkylene chain, they provide, together the C atom to which they are attached, a C<sub>3-8</sub> carbocyclic aliphatic ring.

30 Preferably, R' and R'' are the same and are alkyl, more preferably they are both methyl, ethyl or *n*- or *i*- propyl.

Alternatively, preferably, R' and R'' are, independently, H, methyl (-CH<sub>3</sub>), secondary butyl (-CH<sub>2</sub>-CH-(CH<sub>3</sub>)<sub>2</sub>), benzyl (-CH<sub>2</sub>C<sub>6</sub>H<sub>5</sub>), or, together with the C atom to which they are attached, provide a C<sub>5-6</sub> ring.

- 5 Preferred compounds include those where R' and R'' are both methyl, one of R' and R'' is H and one of R' and R'' is methyl, and R' and R'', together with the C atom to which they are attached, provide a pentyl ring.

When R' and R'' are different, the C atom to which they are attached is chiral. The present  
10 compounds can be L or D or a mixture of stereoisomers. Preferably they are L.

It will be appreciated that the moiety -O-C(O)-CR'R''-NH- corresponds to a carboxy-protected  $\alpha$ -amino acid. R' and R'' can thus correspond to the side chains of a naturally occurring amino acid.

15

For example, when one of R' and R'' is H and one of R' and R'' is Me or PhCH<sub>2</sub>, the moiety corresponds to alanine or phenylalanine, respectively.

Preferably, the stereochemistry at the asymmetric centre -CR'R'' corresponds to an L-  
20 amino acid. The stereochemistry at the asymmetric centre -CR'R'' can, however, correspond to a D-amino acid. Alternatively, mixtures of compounds can be employed having asymmetric centres corresponding to L and D amino acids.

In the present specification by "naturally occurring amino acid" we mean Alanine,  
25 Arginine, Asparagine, Aspartic Acid, Cysteine, Cystine, Glycine, Glutamic Acid, Glutamine, Histidine, Hydroxylysine, Hydroxyproline, Isoleucine, Leucine, Lysine, Methionine, Phenylalanine, Proline, Serine, Threonine, Tryptophan, Tyrosine and Valine.

The present invention is not, however, limited to compounds having a moiety  
30 corresponding to a naturally occurring amino acid. The present invention specifically includes compounds having a moiety which corresponds to a non-naturally occurring amino acid, such as, for example, those where R'=R''=alkyl, or, where together with the C atom to which they are attached, R' and R'' provide a cyclic moiety. Preferably with

respect to the compound of formula I, the moiety ROCOCR'R''NH- corresponds to or is derived from a non-naturally occurring amino acid.

With respect to compounds of formula I when n is 1, the moiety ROCOCR'R''NH-  
5 preferably neither corresponds to nor is derived from alanine, more preferably neither corresponds to nor is derived from either of alanine or tryptophan, even more preferably neither corresponds to nor is derived from any naturally occurring amino acid.

With respect to compounds of formula I when n is 0, the moiety ROCOCR'R''NH-  
10 preferably neither corresponds to nor is derived from alanine, more preferably neither corresponds to nor is derived from either of alanine or tryptophan, even more preferably neither corresponds to nor is derived from any naturally occurring amino acid.

Preferably Q is O.

15

Preferably, X and Y are, independently, selected from the group comprising F, H and OH.

When n is 1, preferably each of X and Y is H.

20 When n is 0, preferably each of X and Y is F, or X is OH and Y is H, or X is H and Y is OH.

When Z is F, Q is O, n is 1 and X and Y are each H, the base moiety of the compound of formula I corresponds to that of fluorodeoxyuridine i.e. compound (1) above.

25

When Z is H, Q is O, n is 0 and X is OH and Y is H, the base moiety of the compound of formula I corresponds to that of cytarabine i.e. compound (2) above.

When Z is H, Q is O, n is 0 and X and Y are each F, the base moiety of the compound of  
30 formula I corresponds to that of gemcitabine i.e. compound (3) above.

When Z is H, Q is O, n is 0 and X is H and Y is OH, the base moiety of the compound of formula I corresponds to that of cytidine.

Compounds of formula I wherein n is 0 and X and Y are F are preferred. Particularly preferred are compounds of formula I wherein n is 0, X and Y are F, Q is O and Z is H, corresponding to phosphoramidated gemcitabine.

5

Also preferred are compounds of formula I wherein n is 0 and X is OH and Y is H. Particularly preferred are compounds of formula I wherein n is 0, X is OH, Y is H, Q is O and Z is H, corresponding to phosphoramidated cytarabine.

- 10 Also preferred are compounds of formula I wherein n is 0 and X is H and Y is OH. Particularly preferred are compounds of formula I wherein n is 0, X is H, Y is OH, Q is O and Z is H, corresponding to phosphoramidated cytidine.

Suitably, Ar is a 5 to 14 membered aromatic ring moiety. The one or two rings may  
15 include 1, 2, 3 or 4 heteroatoms, preferably 1, selected, independently, from O, S and N.

Preferably, Ar is a carbomonocyclic aromatic ring moiety. More preferably, Ar is a C<sub>6</sub> monocyclic aromatic ring moiety, ie is optionally substituted phenyl.

- 20 One, two, three or four substituents, which may be the same or different, may be present on Ar and are selected from the group comprising halogen, which may -F, -Cl, -Br or -I; -NO<sub>2</sub>; -NH<sub>2</sub>; optionally substituted -C<sub>1-3</sub>alkyl; optionally substituted -C<sub>1-3</sub>alkoxy, preferably methoxy (-OCH<sub>3</sub>); optionally substituted -SC<sub>1-3</sub>alkyl; -CN; optionally substituted -COC<sub>1-3</sub>alkyl; and optionally substituted -CO<sub>2</sub>C<sub>1-3</sub>alkyl. The optional substituents are one or  
25 more up to six, preferably three, members selected from the group comprising halogen which may be F, Cl, Br and I and NO<sub>2</sub>. Preferred substituents on Ar include F, Cl, CF<sub>3</sub>, and NO<sub>2</sub>.

The substituents may be at any position on the ring moiety. Where the ring moiety is C<sub>6</sub> ie  
30 phenyl, a single substituent at the 2 (*ortho*) or 4 (*para*) position is preferred. Where Ar is phenyl, a single substituent at the 4 position is more preferred.

Preferably, Ar is an optionally substituted phenyl moiety. More preferably, Ar is selected from the group comprising: Ph-,  $p\text{CF}_3\text{C}_6\text{H}_4$ -,  $p\text{FC}_6\text{H}_4$ -,  $p\text{NO}_2\text{C}_6\text{H}_4$ -,  $p\text{ClC}_6\text{H}_4$ - and  $o\text{ClC}_6\text{H}_4$ -.

- 5 Suitably, Z is selected from the group comprising H,  $\text{C}_{1-6}$  alkyl, substituted  $\text{C}_{1-6}$  alkyl,  $\text{C}_{1-6}$  alkenyl, substituted  $\text{C}_{1-6}$  alkenyl,  $\text{C}_{1-6}$  alkynyl, substituted  $\text{C}_{1-6}$  alkynyl and halogen, where halogen is F, Cl, Br or I. Substituents that may be present on the alkenyl or alkynyl moiety are selected from the group comprising F, Cl, Br, I, and  $-\text{CO}_2\text{Me}$ . One, two or three substituents may be present. The alkenyl and alkynyl groups may contain one or more sites
- 10 of unsaturation.

Where Z is substituted alkenyl or alkynyl, the substituent is preferably on the terminal C atom.

- 15 Preferably Z is selected from the group comprising H, F, optionally substituted  $\text{C}_{1-6}$ alkyl particularly Me ( $-\text{CH}_3$ ), optionally substituted  $\text{C}_{1-6}$ alkenyl and optionally substituted  $\text{C}_{1-6}$ alkynyl, the optional substituents being as recited immediately above.

When n is 1, Z' is O, Q is O and X and Y are each H, preferably Z is a substituted  $\text{C}_2$

20 alkenyl (i.e. ethenyl or vinyl) moiety ( $-\text{CH}=\text{CH}-$ ); more preferably, Z is bromovinyl ( $-\text{CH}=\text{CHBr}$ ) or methylpropenoate ( $-\text{CH}=\text{CHCO}_2\text{Me}$ ); and most preferably, Z is  $-\text{CH}=\text{CHBr}$ .

With respect to compounds of formula II, preferably when n is 1 and X and Y are both H,

25 then Z is not F.

With respect to compounds of formula II, when n is 0, preferably X is not H and Y is not OH, more preferably X is OH and Y is H or X and Y are both F.

- 30 With respect to compounds of formula II, when n is 0, X is OH and Y is H, preferably neither R' nor R'' is phenylmethyl (ie benzyl) or 3-methylindolyl (ie 3- $\text{CH}_2$ indolyl).

Surprisingly, modifying the ester moiety in compound (7) has been found to show a marked increase in potency with respect to cancer cell lines. A preferred compound embodying the present invention is the benzyl ester (8). It has surprisingly been found that the benzyl ester (8) is very significantly more potent against several cancer cell lines than  
5 the methyl ester (7):

Compound (8) inhibits the growth of colon cancer cell line HT115 by 50% at 1.4  $\mu\text{M}$ ,  
10 whilst (7) requires a concentration of 244  $\mu\text{M}$ ; (8) is thus 174 times more potent. Compound (8) is also 8 times more potent than (7) versus prostate cancer cell line PC-3 (19  $\mu\text{M}$  vs. 155  $\mu\text{M}$ ).

The degree of potency enhancement for (8) vs. (7) is surprising based on the prior art.  
15 Thus, comparing the equivalent phosphoramidates of d4T reveals a ca 4-fold potency boost of (10) over (9) [McGuigan et al, AVCC, 1998, 9, 473-9].

20 This would imply that the benzyl phosphoramidate motif in (10) is ca 4-fold more efficient at the intracellular delivery of the bio-active free phosphate forms of d4T than is the methyl ester (9). A person skilled in the art would anticipate a similar degree of

enhancement for the benzyl phosphoramidate of BVDU (8) over the methyl ester (7) whilst we observed an almost 200-fold enhancement for colon cancer as noted above.

Surprising efficacy of modifications in the amino acid and aryl moieties of the BVDU  
5 phosphoramidate has also been found in compounds embodying the present invention.

Thus, compound (11) has simultaneous modification in these two regions, being the p-trifluoromethylphenyl benzyl [ $\alpha,\alpha$ -dimethylglycyl]phosphoramidate.

Compound 11 shows high potency against a range of cancer cell types and is significantly and surprisingly more potent than (7). Thus, for breast cancer (11) is 60-fold more active (1.3 $\mu$ M vs 79  $\mu$ M), and for prostate cancer (11) is 254-fold more potent (0.61  $\mu$ M vs. 155  
15  $\mu$ M). Against colon cancer, (11) is 35-fold more potent (7  $\mu$ M vs 244  $\mu$ M). Again, the degree of enhancement of the analogue (11) vs. (7) is surprising based on prior art. Thus, comparing (12) [dimethyl glycine modification] and (13) [p-CF<sub>3</sub>phenyl modification] to (9) shows no significant difference in potency.

Thus 50% effective doses vs HIV-1 for (9), (12) and (13) are: 0.075, 0.29, and 0.01  $\mu$ M respectively; within experimental error, (12) and (13) are identical in potency to (9). Thus a person skilled in the art would have predicted that (11) would show little enhancement over (7) as opposed to the 35 to 254-fold enhancements noted above.

5

Thus, compounds embodying the present invention and having variations in one or more of the ester (R), amino acid (R', R'') and aryl (Ar) region of the phosphoramidate structure compared to phenyl methoxyalaninyl phosphoramidate can give surprising and substantial potency boosts of pro-tides derived from BVDU against a range of cancer cell types.

10

According to a further aspect of the present invention there is provided a compound having formula I according to the present invention for use in a method of treatment, preferably in the prophylaxis or treatment of cancer.

15 According to a further aspect of the present invention there is provided a method of prophylaxis or treatment of cancer comprising administration to a patient in need of such treatment an effective dose of a compound having formula I according to the present invention.

20 According to a further aspect of the present invention there is provided use of a compound having formula I of the present invention in the manufacture of a medicament for use in the treatment or prophylaxis of cancer.

According to a further aspect of the present invention there is provided a pharmaceutical  
25 composition comprising a compound having formula I of the present invention in combination with a pharmaceutically acceptable excipient, carrier or diluent.

According to a further aspect of the present invention there is provided a method of preparing a pharmaceutical composition comprising the step of combining a compound  
30 having formula I of the present invention with a pharmaceutically acceptable excipient, carrier or diluent.

The present invention is particularly applicable for the treatment of a patient having breast cancer, colon cancer or prostate cancer. Examples of such cancers include breast MDA MB231, colon HT115 and prostate PC-3.

- 5 The compound having formula I or pharmaceutical composition according to the present invention can be administered to a patient, which may be human or animal, by any suitable means.

The medicaments employed in the present invention can be administered by oral or  
10 parenteral routes, including intravenous, intramuscular, intraperitoneal, subcutaneous, transdermal, airway (aerosol), rectal, vaginal and topical (including buccal and sublingual) administration.

For oral administration, the compounds of the invention will generally be provided in the  
15 form of tablets or capsules, as a powder or granules, or as an aqueous solution or suspension.

Tablets for oral use may include the active ingredient mixed with pharmaceutically acceptable excipients such as inert diluents, disintegrating agents, binding agents,  
20 lubricating agents, sweetening agents, flavouring agents, colouring agents and preservatives. Suitable inert diluents include sodium and calcium carbonate, sodium and calcium phosphate, and lactose, while cornstarch and alginic acid are suitable disintegrating agents. Binding agents may include starch and gelatin, while the lubricating agent, if present, will generally be magnesium stearate, stearic acid or talc. If desired, the  
25 tablets may be coated with a material such as glyceryl monostearate or glyceryl distearate, to delay absorption in the gastrointestinal tract.

Capsules for oral use include hard gelatin capsules in which the active ingredient is mixed with a solid diluent, and soft gelatin capsules wherein the active ingredient is mixed with  
30 water or an oil such as peanut oil, liquid paraffin or olive oil.

Formulations for rectal administration may be presented as a suppository with a suitable base comprising for example cocoa butter or a salicylate.

Formulations suitable for vaginal administration may be presented as pessaries, tampons, creams, gels, pastes, foams or spray formulations containing in addition to the active ingredient such carriers as are known in the art to be appropriate.

5

For intramuscular, intraperitoneal, subcutaneous and intravenous use, the compounds of the invention will generally be provided in sterile aqueous solutions or suspensions, buffered to an appropriate pH and isotonicity. Suitable aqueous vehicles include Ringer's solution and isotonic sodium chloride. Aqueous suspensions according to the invention  
10 may include suspending agents such as cellulose derivatives, sodium alginate, polyvinylpyrrolidone and gum tragacanth, and a wetting agent such as lecithin. Suitable preservatives for aqueous suspensions include ethyl and n-propyl p-hydroxybenzoate.

The compounds of the invention may also be presented as liposome formulations.

15

In general a suitable dose will be in the range of 0.1 to 300 mg per kilogram body weight of the recipient per day. A preferred lower dose is 0.5 mg per kilogram body weight of recipient per day, a more preferred lower dose is 6 mg per kilogram body weight of recipient per day, an even more preferred lower dose is 10 mg per kilogram body weight  
20 per recipient per day. A suitable dose is preferably in the range of 6 to 150 mg per kilogram body weight per day, and most preferably in the range of 15 to 100 mg per kilogram body weight per day. The desired dose is preferably presented as two, three, four, five or six or more sub-doses administered at appropriate intervals throughout the day. These sub-doses may be administered in unit dosage forms, for example, containing  
25 10 to 1500 mg, preferably 20 to 1000 mg, and most preferably 50 to 700 mg of active ingredient per unit dosage form.

According to a further aspect of the present invention there is provided a process for the preparation of a compound having formula I according to the present invention, the process  
30 comprising reacting of a compound of formula (III):

with a compound of formula (IV):

wherein Ar, n Q, R, R', R'', X, Y, Z' and Z have the meanings described above with respect  
5 to formula (I).

Embodiments of the present invention will now be described, by way of example only,  
with reference to the following examples, experimental procedures and experimental data.

- 10 Data are presented for a range of structures against tumour cell types representing a range  
of common cancers in man with un-met clinical need: breast MDA MB231, colon HT115,  
prostate PC-3. Data from these assays are presented as Table I.

## Experimental Procedure

15

### *General methods*

The following anhydrous solvents and reagents were bought from Aldrich with sure  
stopper: dichloromethane (DCM), diethyl ether (Et<sub>2</sub>O), tetrahydrofuran THF), N-  
methylimidazole (NMI), methanol (MeOH), dimethylformamide (DMF), 1,4-dioxane.  
20 triethylamine was dried on molecular sieves of 4 Angstrom.

### ***Thin Layer Chromatography***

Thin layer chromatography (TLC) was performed on commercially available Merck Kieselgel 60 F<sub>254</sub> plates and separated components were visualized using ultraviolet light (254 nm and 366 nm).

5

### ***Column Chromatography***

Columns were performed using (Kieselgel 60, 35-70 $\mu$ m, Fluka) as the stationary phase. Samples were applied as a concentrated solution in the same eluent, or pre-adsorbed onto silica gel.

10

### ***NMR Spectroscopy***

<sup>1</sup>H, <sup>13</sup>C and <sup>31</sup>P-NMR were recorded on a Bruker Avance DPX300 spectrometer with operating frequencies of 300MHz, 75MHz and 121MHz respectively. <sup>31</sup>P-NMR spectra are reported in units of  $\delta$  relative to 85% phosphoric acid as external standard, positive shifts are downfield. The following abbreviations are used in the assignment of NMR signals: s (singlet), d (doublet), t (triplet), q (quartet), m (multiplet), bs (broad signal), dd (doublet of doublet), dt (doublet of triplet). Starred signal are splitted due to stereoisomeric mixtures.

### ***Standard procedures***

For practical purposes, standard procedures are given where applicable.

#### ***Standard procedure 1: Synthesis of Amino ester hydrochloride salts.***

To a stirring solution of anhydrous alcohol ( 10 mol eq.) was added thionyl chloride (2 mol eq.) at 0° C, and the resulting solution stirred for 1 hr. After warming to room temperature, the appropriate amino acid (1 mol eq) was added and the reaction heated at reflux for 6-16 hrs. Removal of solvent and recrystallisation from methanol/ether gave the amino ester hydrochloride salts.

#### ***Standard procedure 2: Synthesis of Amino benzyl ester hydrochloride salts.***

The appropriate amino acid (1.0 mol eq.), *p*-toluene sulfonic acid (1.0 mol eq.) and anhydrous benzyl alcohol (4.1 mol eq.) were heated at reflux in toluene (10 mol eq.) with Dean-Stark trap for 24 hrs. On cooling to room temperature, Et<sub>2</sub>O was added and the

30

mixture was left in ice bath for 1hr then filtrated and washed with Et<sub>2</sub>O. The solid was dissolved in DCM and washed with 10% K<sub>2</sub>CO<sub>3</sub> and water. The organic layer was dried over MgSO<sub>4</sub>, filtered and the solvent removed under reduced pressure to give an oil. This was solubilized in acetone and neutralized with 1 M HCl. Et<sub>2</sub>O was added and the solid  
5 was filtered and washed with Et<sub>2</sub>O to give a white solid.

***Standard procedure 3: Synthesis of Phosphorodichloridate species.***

Phosphorus oxychloride (1.0 mol eq.) and the appropriate substituted phenol (1.0 mol) were stirred with anhydrous diethylether (31 mol eq.). To this was added anhydrous  
10 triethylamine (1.0 mol eq) at -80 °C and left to rise to room temperature over 16 hrs. the triethylamine hydrochloride salt was filtered off, and the filtrate reduced to dryness to give the crude product as a clear liquid.

***Standard procedure 4: Synthesis of Phosphochloridate species.***

15 Phosphodichloridate (1.0 mol eq.) and the appropriate amino ester hydrochloric salt (1.0 mol eq.) were suspended in anhydrous DCM. Anhydrous triethylamine was added dropwise at -80 °C and after 1hr the reaction was left to rise to room temperature. The formation of phosphochloridate was monitored by <sup>31</sup>P-NMR. After 2-5 hrs the solvent was removed under reduced pressure and the solid obtained washed with anhydrous ether (2x20  
20 ml), filtered, and the filtrate reduced to dryness to give the products as crude oil. These oils were usually used without further purification.

***Standard procedure 5: Synthesis of Phosphoroamidate derivatives.***

To a stirring solution of (E)-5-(2-bromovinyl)-2'-deoxyuridine (1.0 mol eq.) and the  
25 appropriate phosphochloridate (2.0- 3.0 mol eq) in anhydrous THF at -80°C was added dropwise over 1 min NMI (5.0 mol eq.). After 15 mins the reaction was left to rise to room temperature and stirred at room temperature for 2-19 hrs. The solvent was removed under reduced pressure and the yellow oil obtained was dissolved in DCM, washed with 0.5 M HCl, and water. The organic layer is dried over MgSO<sub>4</sub>, filtered, reduced to dryness and  
30 purified by flash chromatography (Chloroform/Methanol 97/3, Dichloromethane/Methanol 97/3).

**(E)-5-(2-bromovinyl)-2'-deoxyuridine**

20

To a solution of (E)-5-(2-carboxyvinyl)-2'-deoxyuridine (5.777 g, 19.37 mmol) in dimethylformamide (29 mL) was added K<sub>2</sub>CO<sub>3</sub> (5.890 g, 42.61 mmol) and the suspension stirred at room temperature for 15 mins. A solution of N-bromosuccinimide (3.655 g,

20.53 mmol) was added dropwise over 30 mins at 20°C. The resulting suspension was filtered and the solid washed with DMF. The combined filtrate and washings were evaporated to dryness *in vacuo* and the residue dissolved in MeOH. To this silica gel was added and the suspension evaporated to dryness and the solid applied to the top of chromatographic column. The column was eluted with chloroform/methanol 92/8 to give a white solid (5787g, 71.9%). Crystallisation from water gave a white powder.

Experimental data are given in Table I illustrating the activity of compounds embodying the present invention, and of some comparaive compounds, with respect to human breast cancer cell line MDA MB231, human colon cancer cell line HT115 and human prostrate cancer cell line PC-3. The compounds include those whose preparations are described  
15 above and compounds made by preparative methods corresponding to the methods described above.

The experimental procedures used human colon cancer cell line (HT115), human prostate cancer cell line (PC-3), human breast cancer cell line (MDA MB 231) and normal human  
20 umbilical vein endothelial cell (HUVEC). Compounds were diluted over a range of concentrations and added to cells over 1 to 3 days. The cytotoxicity was determined using a MTT assay at the end of each experiment.

In the Table:

25

ArO refers to Ar as defined above with respect to formula I;

J refers to the moiety of the present compounds represented by, respectively, ROCOCR'R''NH-, as defined above with respect to formula I, or, with respect to  
30 Examples 51, 52 and 53, HOCOCR'R''NH-, as defined above with respect to formula II; and

B refers to the base moiety of the present compounds as defined above with respect to formula I or formula II.

BVU stands for 2-bromovinyl uridine.

5

5-(C=CC[O]O)MeU stands for methyl propenoate-2'-deoxyuridine.

GemCyt stands for Gemcitabine.

10 Examples A, 1, 67 and G are comparative Examples.

Example A is 5-(2-Bromovinyl)-2'-deoxyuridine.

Example 1 is Example 1 above corresponding to compound (7) above.

15

Example 67 is propenate-2'-deoxyuridine.

Example G is gemcitabine.

20 Examples 51, 52 and 53 are compounds embodying formula II above.

Gemcitabine (Example G in the Table) and compound CPF31 (Example 31 in the Table: gemcitabine-[phenyl-(benzoxo-L-alaninyl)]-phosphate) were compared in a mouse model  
5 with xenografts of human cancer (colon HT115 and prostate PC3).

Mice were dosed daily at a range of concentrations (0.01-10 $\mu$ M) and tumour volume assessed versus control.

10 Kaplan-Meier statistics were computed regarding incident-free survival.

In the attached drawings:

Figure 1 shows for the mouse xenograft the tumour volume for prostate data at day 13  
15 using Gemzar<sup>TM</sup> (gemcitabine available ex. Lilly);

Figure 2 shows for the mouse xenograft the tumour volume for prostate data at day 13 using CPF31;

20 Figure 3 shows the incident free survival functions v. day for each of CPF31 and gemcitabine; and

Figure 4 shows for the mouse xenograft the tumour volume for colon data at day 24 using, respectively, Gemzar and compound CPF31.

Referring to the drawings, CPF31 can be seen to be significantly less toxic than  
5 gemcitabine.

CPF31 was significantly effective at reducing prostate and colon tumour volume relative to control at daily dosing of 5 and 10  $\mu$ M (3 and 6  $\mu$ g/ml). Gemcitabine was not effective at the highest non-toxic concentration.

10

Gemzar is seen from Figure 1 to be toxic above 1 $\mu$ M. In contrast, CPF31 is seen from Figure 2 to have substantially lower toxicity.

Figure 3 shows that CPF31 has significantly lower side effects on a comparable basis: 3  
15 animals show serious toxicity (10% body mass loss) in GMZ and in CPF31 on day 10, collectively 4 in GMZ and 1 in CPF31 on day 11 and 5 in GMZ and 1 in CPF on day 13. Using Chi square analysis by combining 5 and 10 $\mu$ M groups, the significance is  $p=0.193$ , 0.078 and 0.0289 on day 10, 11 and 13. It is clear that by day 13, CPF31 displayed significantly less side effects, and the anti-cancer effects continue to exceed that of Gemzar.

20

Figure 3 shows the Kaplan-Meier survival curve, incidence free survival: based on the loss according to weight loss. A Cox proportion analysis shows that CPF31 is far less toxic than GMZ based on the weight-loss calculated loss ( $p=0.043$ ).

25 CPF31 was found to be active at 5 $\mu$ M *in vitro*, whereas Gemzar was found to be active at 600 $\mu$ M, with respect to the same colon cell line. Figure 4 shows the results of testing both *in vivo* at 5 $\mu$ M. The greater activity of CPF31 in reducing tumour volume is shown in Figure 4.

## CLAIMS.

1. A chemical compound having formula I:

5 wherein:

R is selected from the group comprising alkyl, aryl and alkylaryl;

R' and R'' are independently selected from the group comprising H, alkyl and alkylaryl, or

R' and R'' together form an alkylene chain so as to provide, together with the C atom to which they are attached, a cyclic system;

10 Q is selected from the group comprising -O- and -CH<sub>2</sub>-;

X and Y are independently selected from the group comprising H, F, Cl, Br, I, OH and methyl (-CH<sub>3</sub>);

Ar is a monocyclic aromatic ring moiety or a fused bicyclic aromatic ring moiety, either of which said ring moieties is carbocyclic or heterocyclic and is optionally substituted;

15 Z is selected from the group comprising H, alkyl and halogen; and

$n$  is 0 or 1,

wherein when n is 0, Z' is -NH<sub>2</sub> and a double bond exists between position 3 and position 4, and

when  $n$  is 1,  $Z'$  is  $=0$ ;

20 or a pharmaceutically acceptable derivative or metabolite of a compound of formula I;

with the proviso that, except where R is 2-Bu ( $-\text{CH}_2-\text{CH}(\text{CH}_3)_2$ ) and one of R' and R'' is H and one of R' and R'' is methyl ( $-\text{CH}_3$ ), when n is 1 and X and Y are both H, then Ar is not unsubstituted phenyl ( $-\text{C}_6\text{H}_5$ ).

2. A compound according to claim 1 wherein R is selected from the group comprising a C<sub>1-16</sub> primary or secondary alkyl group, a C<sub>5-7</sub> carbocyclic aryl group or a C<sub>1-6</sub>alkylC<sub>5-11</sub> aryl group.
- 5 3. A compound according to claim 2 wherein R is selected from the group comprising methyl (-CH<sub>3</sub>), ethyl (-C<sub>2</sub>H<sub>5</sub>) and benzyl (-CH<sub>2</sub>C<sub>6</sub>H<sub>5</sub>).
4. A compound according to claim 3 wherein R is benzyl.
- 10 5. A compound according to any one of the preceding claims wherein Ar is an optionally substituted C<sub>6</sub> monocyclic aromatic ring moiety, ie is optionally substituted phenyl.
6. A compound according to claim 5 wherein Ar is selected from the group
- 15 comprising -C<sub>6</sub>H<sub>5</sub>, *p*CF<sub>3</sub>C<sub>6</sub>H<sub>4</sub>-, *p*FC<sub>6</sub>H<sub>4</sub>-, *p*NO<sub>2</sub>C<sub>6</sub>H<sub>4</sub>-, *p*ClC<sub>6</sub>H<sub>4</sub>- and *o*ClC<sub>6</sub>H<sub>4</sub>-.
7. A chemical compound having formula II:

- wherein n, Q, R, R', R'', X, Y, Z and Z' have the meanings described in claim 1, and
- 20 additionally R can be H, with provisos that:
- when n is 1, X and Y are both H, R is methyl (-CH<sub>3</sub>), one of R' and R'' is H and one of R' and R'' is methyl (-CH<sub>3</sub>), then Z is not -CH=CHBr;
- when n is 1, X and Y are both H, R is methyl (-CH<sub>3</sub>), one of R' and R'' is H and one of R' and R'' is phenylethyl, phenylmethyl, indol-3-ylmethyl or indol-3-ylethyl, then Z is not F;
- 25 and
- when n is 0, X is not H.

8. A compound according to any one of the preceding claims wherein R' and R'' are, independently, selected from the group comprising H, C<sub>1-6</sub> primary, secondary and tertiary alkyl, C<sub>1-3</sub>alkylC<sub>5-7</sub> aryl, or, when together they form an alkylene chain, they provide,  
5 together with the C atom to which they are attached, a C<sub>3-8</sub> carbocyclic aliphatic ring.
9. A compound according to claim 8 wherein R' and R'' are, independently, selected from the group comprising H, methyl, benzyl and -CH<sub>2</sub>CH(CH<sub>3</sub>)<sub>2</sub>, or, R' and R'' together with the C atom to which they are attached, provide a C<sub>5-6</sub> ring.  
10
10. A compound according to claim 9 wherein R' and R'' are each methyl.
11. A compound according to claim 9 wherein one of R' and R'' is H and one of R' and R'' is methyl.  
15
12. A compound according to claim 9 wherein the carbocyclic ring is a pentyl ring.
13. A compound according to any one of the preceding claims wherein R' and R'' correspond to the side chains of a naturally occurring amino acid.  
20
14. A compound according to any one of the preceding claims wherein Z is selected from the group comprising H, C<sub>1-6</sub>alkyl, substituted C<sub>1-6</sub>alkyl, C<sub>1-6</sub>alkenyl, substituted C<sub>1-6</sub>alkenyl, C<sub>1-6</sub>alkynyl, and halogen.
- 25 15. A compound according to any one of the preceding claims wherein Q is O.
16. A compound according to any one of the preceding claims wherein when n is 1, each of X and Y is H.
- 30 17. A compound according to any one of claims 1 to 15 wherein when n is 0, each of X and Y is F.

18. A compound according to any one of claims 1 to 15 wherein when n is 0, X is OH and Y is H.
19. A compound according to any one of claims 1 to 15 wherein when n is 0, X is H and Y is OH.
20. A compound selected from the group comprising:

Gemcitabine-[phenyl-(benzoxy-L-alaninyl)]-phosphate (CPF 31)

Gemcitabine-[para-chlorophenyl-(benzoxy-L-alaninyl)]-phosphate (CPF 40) and

Gemcitabine-[para-chlorophenyl-(benzoxy- $\alpha,\alpha$ -dimethylglycinyl)]-phosphate (CPF 41).

5 21. A compound according to any one of claims 1 to 6, claim 20, or to any one of  
claims 8 to 19 as dependent on any one of claims 1 to 6, for use in a method of treatment,  
preferably in the prophylaxis or treatment of cancer, with the proviso that when n is 1, X  
and Y are both H, one of R' and R'' is H and one of R' and R'' is methyl (CH<sub>3</sub>), R is 2-Bu  
(-CH<sub>2</sub>-CH-(CH<sub>3</sub>)<sub>2</sub>) or R is benzyl (-CH<sub>2</sub>C<sub>6</sub>H<sub>5</sub>), then Ar can be unsubstituted phenyl (-  
10 C<sub>6</sub>H<sub>5</sub>).

22. Use of a compound according to any one of claims 1 to 6, claim 20, or to any one  
of claims 8 to 19 as dependent on any one of claims 1 to 6, in the manufacture of a  
medicament for the prophylaxis or treatment of cancer, with the proviso set out in claim  
15 21.

23. A method of prophylaxis or treatment of cancer comprising administration to a  
patient in need of such treatment an effective dose of a compound according to any one of  
claims 1 to 6, claim 20, or to any one of claims 8 to 19 as dependent on any one of claims 1  
20 to 6, with the proviso set out in claim 21.

24. A pharmaceutical composition comprising a compound according to any one of  
claims 1 to 6, claim 20, or to any one of claims 8 to 19 as dependent on any one of claims 1  
to 6, in combination with a pharmaceutically acceptable carrier, diluent or excipient.  
25

25. A method of preparing a pharmaceutical composition comprising the step of  
combining a compound according to any one of claims 1 to 6, claim 20 or any one of  
claims 8 to 19 as dependent on any one of claims 1 to 6, with a pharmaceutically  
acceptable excipient, carrier or diluent.

26. A process for the preparation of a compound of formula I according to claim 1, the process comprising reacting of a compound of formula (III):

5 with a compound of formula (IV)

wherein Ar, n, Q, R, R', R'', X, Y, Z' and Z'' have the meanings described in claim 1.

## A. CLASSIFICATION OF SUBJECT MATTER

INV. C07H19/10 C07H19/20 C07H21/00 C12Q1/68 G01N33/53

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

C07H C12Q G01N

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the International search (name of data base and, where practical, search terms used)

EPO-Internal, WPI Data, BEILSTEIN Data, CHEM ABS Data

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

### \* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier document but published on or after the International filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the International filing date but later than the priority date claimed

"T" later document published after the International filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance: the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance: the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

# INTERNATIONAL SEARCH REPORT

International application No.  
PCT/EP2005/013062

## Box II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:
2. ☐ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 8.4(a).

## Box III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☒ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; It is covered by claims Nos.:

1-7(in part),9-52(in part)

Remark on Protest

☐ The additional search fees were accompanied by the applicant's protest.

☐ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

This International Searching Authority found multiple (groups of) inventions in this international application, as follows:

1. claims: 1-7 (in part), 9-52 (in part)

Nucleotide according to claim 1 having an activated phosphor ester selected from the group of structures according to formulas (II)-(VII) of claim 4 (i.e. containing a five membered unsaturated ring having three nitrogens in the ring), and methods, uses and kits pertaining thereto.

---

2. claims: 1-7 (in part), 9-52 (in part)

Nucleotide according to claim 1 having an activated phosphor ester selected from the group of structures according to formulas (VIII)-(IX) of claim 4 (i.e. containing a five membered unsaturated ring having four nitrogens in the ring), and methods, uses and kits pertaining thereto.

---

3. claims: 1-4 (in part), 6 (in part), 9-52 (in part)

Nucleotide according to claim 1 having an activated phosphor ester with structure (X) of claim 4, and methods, uses and kits pertaining thereto.

---

4. claims: 1-4 (in part), 6 (in part), 8 (in full), 9-52 (in part)

Nucleotide according to claim 1 having an activated phosphor ester selected from the group of structures according to formulas (XI)-(XIII) and (XV)-(XIX) of claim 4 and of claim 8 (i.e. containing a six-membered ring), and methods, uses and kits pertaining thereto.

---

5. claims: 1-4 (in part), 6 (in part), 9-52 (in part)

Nucleotide according to claim 1 having an activated phosphor ester with structure (XIV) of claim 4, and methods, uses and kits pertaining thereto.

---

6. claims: 1-3 (in part), 9-52 (in part)

Nucleotide according to claim 1 having an activated phosphor ester not falling within one of the earlier mentioned subjects, and methods, uses and kits pertaining thereto.

---

7. claims: 1-3 (in part), 9-52 (in part)

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Nucleotide according to claim 1 having an activated  
carboxylic ester, and methods, uses and kits pertaining  
thereto.
